

**Testamently**

## THE OPPORTUNITY

# The half *they'll need.*

A private vault for the codes, locations and final words that unlock what someone leaves behind — released to the people they trust, only when their check-ins stop. **Breach-proof by design.**

RAISING

**\$ — pre-seed**

STAGE

**Live product · early  
users**

CATEGORY

**Digital legacy**

## THE PROBLEM

# When someone dies, the access dies with them.

The information needed to settle a life is scattered across phones, safes and people's heads — and most of it is simply lost. Existing tools ask for the one thing nobody wants to upload: live passwords.

**\$—B**

life-insurance benefits go **unclaimed** — families never knew the policy existed.

**~20%**

of all Bitcoin is estimated **lost forever** — keys that died with their owner.

**1 in 2**

adults have **no will or plan**, and no record of where anything is.

## Store the half that's *useless to a thief*.

People won't trust an app with their live bank password. They *will* trust it with the safe combination or the phone PIN — because alone, those open nothing. That single reframe unlocks the market and gives us a security claim no password manager can make.

### **We keep the code**

The PIN, the combination, where it's kept — encrypted, released only on the owner's terms.

### **Their home keeps the thing**

The phone, the wallet, the safe — never uploaded. A breach of us reveals nothing usable.

### **Released at the right time**

Only the chosen trustees, only once both halves meet, only after the dead-man's switch.

# Calm, minimal, and it explains itself.

A working app: store records in two taps, assign who receives them, and a check-in “dead-man’s switch” that releases everything at the right moment — in plain language throughout.

## WHY IT WINS

# A moat made of trust.

Defensibility comes from the architecture and the relationship, not a feature.

### 🛡️ **A claim no one else can make**

"Even if we're hacked, your secrets are safe."  
Split-knowledge isn't marketing — it's architecture.

### 💖 **Emotion + utility**

It saves money (unclaimed policies, lost crypto) *and* carries the irreplaceable (letters, photos).

### 📅 **Sticky & recurring**

People add to it for years and check in monthly. Trustees become tomorrow's owners — built-in virality.

### ⚖️ **Complements, never competes**

Not a will — it points families *to* the will and solicitor. Friendly to lawyers, insurers, banks.

# Freemium, with security as the upgrade.

Free to start; people pay for stronger encryption, more records, and a family plan.  
Encryption tiers are already built.

## Free

£0

- Up to 10 records
- Standard encryption
- 2 trustees

## Premium

£—/mo

- Unlimited records
- Premium & Gold
- Files & crypto

## Zero-knowledge

£—/mo

- We can never decrypt
- Most sensitive

## Family

£—/yr

- Shared seats
- One plan, whole family

**Traction:** [ — waitlist signups · — active vaults · — protected records ] · live on web + mobile shell.

# Make sure nothing important is ever lost again.

We're raising \$ — to grow the team and reach the millions who'll need this.
